

Solvent Mediated Enhanced Mobility Of PPV Films Cast Under The Presence Of A Static Electric Field

Supplementary

Chou Fan Liang, Jonathon David White, Yi Fang Huang, Wunshain Fann

Fig. S1. The photocurrent transient (TOF signal) in (a) linear scale and (b) at log-log scale (the arrow points the transit time) at 305 K with a 25V potential applied across the sample for the film prepared from MEH-PPV dissolved in chlorobenzene solvent. A 3.5kV potential was applied between the electrodes during drop casting. The crossing point of the blue lines represents the transit time.
